Lab Task: PHP Form Validation with Cookies

Implementing PHP Form Validation and Cookies

Create a **Student Registration Form** for a university website. The form should collect the following information:

1. Student Name
2. Student ID
3. Email
4. Department
5. Password

After submitting the form, PHP should validate all information. If the information is valid, the student's name and ID should be stored in cookies so that the information can be displayed when the student visits the page again.

Task Requirements

Part 1: Create the Form

Create an HTML/PHP form containing:

- Student Name
- Student ID
- Email
- Department
- Password
- Confirm Password
- Submit button
- Clear Cookie button

Use the POST method.

Part 2: PHP Validation

When the user submits the form, validate the following:

Student Name

- Cannot be empty.
- Should contain only letters and spaces.

Student ID

- Cannot be empty.
- Must contain at least 4 characters.

Email

- Cannot be empty.
- Must be a valid email address.

Department

- Must be selected.

Password

- Cannot be empty.
- Must contain at least 6 characters.

Display appropriate error messages if any validation fails.

Example:

Student Name is required.

Please enter a valid email address.

Part 3: Implement Cookie

If all validation is successful, create cookies using PHP.

Store:

student_name

student_id

The cookies should remain available for **1 hour**.

Part 4: Display Cookie Information

When the page is opened, check whether the cookies already exist.

If cookies exist, display:

Welcome Back!

Student Name: Rahim Ahmed

Student ID: 2026001

If no cookie exists, display:

No saved student information found.

Part 5: Delete Cookie

Create a **Clear Cookie** button.

When the button is clicked, delete the stored cookies. After deleting the cookies, display: Cookie deleted successfully.
